CONSULTING - SPECIFYING
engineer

The next installment in Consulting-Specifying Engineer's Educational Webcast Series specifically addresses what engineers can do to meet or beat the energy standard, which is a critical component of LEED and has also become the default energy code for most states. Commercial, Institutional and Industrial building projects that employ innovative energy efficient technologies will be used as case studies. We'll educate engineers on what it takes to design and specify building systems that result in high performance buildings:

- energy recovery
- better envelopes and fenestration
- more efficient chiller plants
- more efficient lighting and lighting controls
- alternative energy sources
